System Requirements 4
Version 1.4 Enhancements and Fixes 5

System Requirements

- Windows 7 or Windows 10 (Windows 10 is recommended as it gives live pop-up notifications in the notification area. Windows 7 does not.)
- .NET 4.6.1
- Internet Connection (Either this computer or another computer on your organization's LAN needs an Internet connection. You can point non-Internet computers to an offline cache location on your LAN. For more information, see the Help documentation.)
- Access to TCP/IP and UDP, ports 80 and 8089 (The computer with Internet connection needs to open ports 80 and 8089). The software uses Port 80 for all update traffic and port 8089 for real-time web traffic (SignalR).
- Access to these servers:
 - <http://webupdater.hexagonmi.com/v2>
 - <http://webupdater.hexagonmi.com/Management>

Version 1.4 Enhancements and Fixes

- You can now get updates for Blade, BladeRunner, DataPage+, PC-DMIS Gear, and WebReporter through Universal Updater. You need to input the proper access keys to see these products. See HAC-1406.
- Universal Updater now runs with standard privileges after an install. Previously, it ran as an administrator, but that caused problems in some instances. See HAC-1397.
- The Help content now shows information about what ports you need to open to allow access. See HAC-1395.
- You can now see a "Metrology Devices" group for Romer and tracker-related items. Also, the "Metrology" and "Production" groups are now called "Metrology Software" and "Production Software". See HAC-1386.
